# Blood Preg Test

## The name of the test is BioPRYN<sup>®</sup>

- It is a pregnancy test that is done in the lab on a blood sample from a cow or heifer.

## Is it accurate?

- YES - **97% accurate**. Open cows just aren't missed. False pregnancies (false positives) are rare but can occur if the embryo is dead or dying when the sample is taken — so you would re-test.

## How do I use it?

- Best used in consultation with herd veterinarian
- Embryo safe
- Take blood sample at least 30 days after breeding and at least 90 days after calving
- Collect 2 mL of blood in a red-top tube and label with cow ID
- Fill out lab submission form
- Package for safe delivery (no ice needed) and ship to Palliser Labs (Lethbridge)

**(Palliser Labs also offers milk cultures and disease testing for Johne's, BVD, Leukosis, Brucellosis and Neospora.)**
